Task

Execute the web development projects outlined in the plan, which include designing a portfolio website, an online store product page, an event registration form, a resume website, a restaurant menu page, and finally summarizing the completed tasks.

Design Portfolio Website (Task 1)

Subtask:

Create the HTML structure for 'About Me', 'Projects', and 'Contact' sections, apply CSS for styling, implement a responsive layout using Grid/Flexbox, and add smooth scrolling navigation.

Reasoning: The first step in creating the portfolio website is to set up the basic HTML structure. This includes creating the `index.html` file, defining the `head` and `body` sections, and adding placeholder content for 'About Me', 'Projects', and 'Contact' sections, along with a navigation bar.

```
%%writefile index.html
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-
scale=1.0">
    <title>My Portfolio</title>
    <link rel="stylesheet" href="style.css">
</head>
<body>
    <nav>
        <ul>
            <li><a href="#about">About Me</a></li>
            <li><a href="#projects">Projects</a></li>
            <li><a href="#contact">Contact</a></li>
        </ul>
    </nav>

    <section id="about">
        <h1>About Me</h1>
        <p>This is the 'About Me' section. I am a passionate data
scientist with a strong background in machine learning and data
analysis.</p>
        <p>I enjoy transforming complex datasets into actionable
insights and building innovative solutions.</p>
    </section>
```

```
    <section id="projects">
        <h1>Projects</h1>
        <p>This is the 'Projects' section. Here I will showcase my
work, including data analysis projects, machine learning models, and
visualizations.</p>
        <p>Stay tuned for exciting projects!</p>
    </section>

    <section id="contact">
        <h1>Contact</h1>
        <p>This is the 'Contact' section. Feel free to reach out to me
via email or connect with me on LinkedIn.</p>
        <p>Email: example@example.com | LinkedIn: /in/yourprofile</p>
    </section>

    <script src="script.js"></script>
</body>
</html>
print("Created index.html with basic structure.")
```

```
Writing index.html
```

Reasoning: Now that the HTML structure is in place, the next step is to create the `style.css` file to add basic styling to the portfolio website, including a color palette and typography, to establish an overall aesthetic.

```
%%writefile style.css
:root {
    --primary-color: #3498db; /* Blue */
    --secondary-color: #2ecc71; /* Green */
    --text-color: #333;
    --background-color: #f4f4f4;
    --light-text-color: #777;
}

body {
    font-family: 'Arial', sans-serif;
    margin: 0;
    padding: 0;
    box-sizing: border-box;
    background-color: var(--background-color);
    color: var(--text-color);
    line-height: 1.6;
}

nav {
    background-color: var(--primary-color);
    color: #fff;
    padding: 1rem 0;
```

```
    position: sticky;
    top: 0;
    z-index: 1000;
    box-shadow: 0 2px 5px rgba(0,0,0,0.2);
}

nav ul {
    list-style: none;
    padding: 0;
    margin: 0;
    display: flex;
    justify-content: center;
    gap: 20px;
}

nav ul li a {
    color: #fff;
    text-decoration: none;
    font-weight: bold;
    padding: 0.5rem 1rem;
    transition: background-color 0.3s ease;
}

nav ul li a:hover {
    background-color: rgba(255, 255, 255, 0.2);
    border-radius: 5px;
}

section {
    padding: 60px 20px;
    margin: 0 auto;
    max-width: 960px;
    text-align: center;
    background-color: #fff;
    margin-bottom: 20px;
    border-radius: 8px;
    box-shadow: 0 4px 8px rgba(0,0,0,0.1);
}

h1 {
    color: var(--primary-color);
    margin-bottom: 20px;
    font-size: 2.5em;
}

p {
    font-size: 1.1em;
    color: var(--light-text-color);
}
```

```
/* Basic responsive layout using Flexbox */
body {
    display: flex;
    flex-direction: column;
    min-height: 100vh;
}

main {
    flex: 1;
}

@media (max-width: 768px) {
    nav ul {
        flex-direction: column;
        align-items: center;
    }

    nav ul li {
        margin-bottom: 10px;
    }

    section {
        padding: 40px 15px;
    }

    h1 {
        font-size: 2em;
    }
}

@media (max-width: 480px) {
    nav ul li a {
        font-size: 0.9em;
    }

    section {
        padding: 30px 10px;
    }

    h1 {
        font-size: 1.8em;
    }
}
print("Created style.css with basic styling and responsive rules.")

Writing style.css
```

Reasoning: With the HTML structure and CSS styling in place, the next step is to implement the smooth scrolling navigation feature. This will be done by creating a JavaScript file (`script.js`) and adding an event listener to the navigation links to handle smooth scrolling.

```
%%writefile script.js
document.querySelectorAll('nav ul li a').forEach(anchor => {
    anchor.addEventListener('click', function (e) {
        e.preventDefault();

document.querySelector(this.getAttribute('href')).scrollIntoView({
            behavior: 'smooth'
        });
    });
});

print("Created script.js with smooth scrolling functionality.")
```

```
Overwriting script.js
```

Design Online Store Product Page (Task 2)

Subtask:

Develop the HTML for a product display page including image, title, price, and an 'Add to Cart' button. Style the page using CSS following BEM methodology, ensure a responsive layout, and add hover effects. Implement JavaScript for an 'Add to Cart' alert.

Reasoning: The first step is to create the basic HTML structure for the product display page in `product.html`, including linking the CSS and JavaScript files, and adding placeholders for product details as per the instructions.

```
%%writefile product.html
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-
scale=1.0">
    <title>Product Display Page</title>
    <link rel="stylesheet" href="product_style.css">
</head>
<body>
    <div class="product">
        <div class="product__image-container">
            <img src="https://via.placeholder.com/400" alt="Product
Image" class="product__image">
        </div>
        <div class="product__details">
            <h1 class="product__title">Product Name</h1>
            <p class="product__price">$99.99</p>
            <p class="product__description">This is a detailed
description of the product. It highlights the key features, benefits,
```

```
and specifications of the item, enticing customers to make a
purchase.</p>
            <button class="product__button product__button--add-to-
cart">Add to Cart</button>
        </div>
    </div>

    <script src="product_script.js"></script>
</body>
</html>
print("Created product.html with basic structure for product
display.")
```

```
Writing product.html
```

Reasoning: Now that the HTML structure for the product page is set up, the next step is to create the `product_style.css` file to apply styling using BEM methodology, ensure responsiveness, and add hover effects, as specified in the subtask.

```
%%writefile product_style.css
:root {
    --primary-color: #e74c3c; /* Reddish */
    --secondary-color: #2ecc71; /* Green */
    --text-color: #333;
    --background-color: #f8f8f8;
    --light-text-color: #777;
    --border-color: #ddd;
}

body {
    font-family: 'Segoe UI', Tahoma, Geneva, Verdana, sans-serif;
    margin: 0;
    padding: 20px;
    box-sizing: border-box;
    background-color: var(--background-color);
    color: var(--text-color);
    line-height: 1.6;
    display: flex;
    justify-content: center;
    align-items: center;
    min-height: 100vh;
}

.product {
    display: flex;
    flex-direction: column;
    background-color: #fff;
    border-radius: 10px;
    box-shadow: 0 5px 20px rgba(0, 0, 0, 0.1);
```

```
    overflow: hidden;
    max-width: 900px;
    width: 100%;
    margin: 20px;
}

.product__image-container {
    flex: 1;
    min-height: 250px; /* Ensure image container has a minimum height
*/
    display: flex;
    justify-content: center;
    align-items: center;
    background-color: #f0f0f0;
}

.product__image {
    max-width: 100%;
    height: auto;
    display: block;
    transition: transform 0.3s ease;
}

.product__image:hover {
    transform: scale(1.05);
}

.product__details {
    flex: 1;
    padding: 30px;
    display: flex;
    flex-direction: column;
    justify-content: space-between;
}

.product__title {
    font-size: 2.5em;
    color: var(--primary-color);
    margin-top: 0;
    margin-bottom: 15px;
}

.product__price {
    font-size: 2em;
    color: var(--secondary-color);
    font-weight: bold;
    margin-bottom: 20px;
}

.product__description {
```

```
    font-size: 1.1em;
    color: var(--light-text-color);
    margin-bottom: 30px;
    line-height: 1.8;
}

.product__button {
    display: inline-block;
    padding: 15px 30px;
    font-size: 1.2em;
    font-weight: bold;
    border: none;
    border-radius: 8px;
    cursor: pointer;
    transition: background-color 0.3s ease, transform 0.2s ease;
}

.product__button--add-to-cart {
    background-color: var(--primary-color);
    color: #fff;
}

.product__button--add-to-cart:hover {
    background-color: #c0392b;
    transform: translateY(-2px);
}

/* Responsive Layout */
@media (min-width: 768px) {
    .product {
        flex-direction: row;
    }

    .product__image-container {
        border-right: 1px solid var(--border-color);
    }

    .product__details {
        padding-left: 40px;
    }
}

@media (max-width: 767px) {
    body {
        padding: 10px;
    }

    .product {
        margin: 10px;
    }
```

```
    .product__image-container {
        border-bottom: 1px solid var(--border-color);
    }

    .product__details {
        padding: 20px;
        text-align: center;
    }

    .product__title {
        font-size: 2em;
    }

    .product__price {
        font-size: 1.8em;
    }

    .product__button {
        width: 100%;
    }
}

@media (max-width: 480px) {
    .product__title {
        font-size: 1.8em;
    }

    .product__price {
        font-size: 1.5em;
    }

    .product__description {
        font-size: 1em;
    }

    .product__button {
        padding: 12px 20px;
        font-size: 1.1em;
    }
}
print("Created product_style.css with BEM styling, responsiveness, and
hover effects.")
```

```
Writing product_style.css
```

Reasoning: Now that the HTML and CSS for the product page are in place, the final step for this subtask is to implement the 'Add to Cart' alert functionality using JavaScript. This will involve creating the `product_script.js` file and adding an event listener to the 'Add to Cart' button.

```
%%writefile product_script.js
document.addEventListener('DOMContentLoaded', () => {
    const addToCartButton = document.querySelector('.product__button--
add-to-cart');
    if (addToCartButton) {
        addToCartButton.addEventListener('click', () => {
            alert('Item added to cart!');
        });
    }
});

print("Created product_script.js with 'Add to Cart' alert
functionality.")
```

```
Writing product_script.js
```

Build Event Registration Form (Task 3)

Subtask:

Construct an HTML form to collect name, email, phone number, and session selection. Apply CSS for a professional look. Implement JavaScript for form validation.

Reasoning: The first step for creating the event registration form is to construct the basic HTML structure in `registration.html` with input fields for name, email, phone number, and session selection, along with labels and a submit button, and link to the CSS and JavaScript files.

```
%%writefile registration.html
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-
scale=1.0">
    <title>Event Registration Form</title>
    <link rel="stylesheet" href="registration_style.css">
</head>
<body>
    <div class="container">
        <h1>Event Registration</h1>
        <form id="registrationForm">
            <div class="form-group">
                <label for="name">Name:</label>
                <input type="text" id="name" name="name" required>
            </div>

            <div class="form-group">
                <label for="email">Email:</label>
                <input type="email" id="email" name="email" required>
```

```
            </div>

            <div class="form-group">
                <label for="phone">Phone Number:</label>
                <input type="tel" id="phone" name="phone" pattern="[0-
9]{3}-[0-9]{3}-[0-9]{4}" placeholder="e.g., 123-456-7890" required>
                <small>Format: 123-456-7890</small>
            </div>

            <div class="form-group">
                <label for="session">Choose Session:</label>
                <select id="session" name="session" required>
                    <option value="">--Please choose an option--
</option>
                    <option value="keynote">Keynote Speech</option>
                    <option value="workshop1">Workshop A: Web Design
Basics</option>
                    <option value="workshop2">Workshop B: Advanced
CSS</option>
                    <option value="panel">Panel Discussion</option>
                </select>
            </div>

            <button type="submit">Register</button>
        </form>
    </div>

    <script src="registration_script.js"></script>
</body>
</html>
print("Created registration.html with event registration form
structure.")

Writing registration.html
```

Reasoning: Now that the HTML structure for the registration form is in place, the next step is to create the `registration_style.css` file to apply a professional look to the form, as specified in the subtask.

```
%%writefile registration_style.css
:root {
    --primary-color: #4CAF50; /* Green */
    --secondary-color: #2196F3; /* Blue */
    --text-color: #333;
    --background-color: #f2f2f2;
    --light-text-color: #666;
    --border-color: #ccc;
    --error-color: #f44336;
}
```

```
body {
    font-family: 'Roboto', sans-serif;
    margin: 0;
    padding: 0;
    box-sizing: border-box;
    background-color: var(--background-color);
    color: var(--text-color);
    line-height: 1.6;
    display: flex;
    justify-content: center;
    align-items: center;
    min-height: 100vh;
}

.container {
    background-color: #fff;
    padding: 30px 40px;
    border-radius: 10px;
    box-shadow: 0 4px 15px rgba(0, 0, 0, 0.1);
    max-width: 500px;
    width: 100%;
    margin: 20px;
}

h1 {
    text-align: center;
    color: var(--primary-color);
    margin-bottom: 30px;
    font-size: 2em;
}

.form-group {
    margin-bottom: 20px;
}

.form-group label {
    display: block;
    margin-bottom: 8px;
    font-weight: bold;
    color: var(--light-text-color);
}

.form-group input[type="text"],
.form-group input[type="email"],
.form-group input[type="tel"],
.form-group select {
    width: calc(100% - 20px);
    padding: 12px;
    border: 1px solid var(--border-color);
    border-radius: 6px;
```

```
    font-size: 1em;
    box-sizing: border-box;
    transition: border-color 0.3s ease;
}

.form-group input:focus,
.form-group select:focus {
    border-color: var(--primary-color);
    outline: none;
}

.form-group small {
    display: block;
    margin-top: 5px;
    color: var(--light-text-color);
    font-size: 0.9em;
}

button[type="submit"] {
    width: 100%;
    padding: 15px;
    background-color: var(--primary-color);
    color: white;
    border: none;
    border-radius: 6px;
    font-size: 1.1em;
    font-weight: bold;
    cursor: pointer;
    transition: background-color 0.3s ease, transform 0.2s ease;
}

button[type="submit"]:hover {
    background-color: #45a049;
    transform: translateY(-2px);
}

button[type="submit"]:active {
    transform: translateY(0);
}

/* Responsive Design */
@media (max-width: 600px) {
    .container {
        padding: 25px 25px;
        margin: 10px;
    }

    h1 {
        font-size: 1.8em;
    }
```

```
    .form-group input,
    .form-group select,
    button[type="submit"] {
        font-size: 0.95em;
        padding: 10px;
    }
}
print("Created registration_style.css with professional styling.")
```

```
Writing registration_style.css
```

Reasoning: Now that the HTML structure and CSS styling for the registration form are in place, the final step for this subtask is to implement the form validation using JavaScript. This will involve creating the `registration_script.js` file and adding validation logic to it.

```
%%writefile registration_script.js
document.addEventListener('DOMContentLoaded', () => {
    const form = document.getElementById('registrationForm');

    form.addEventListener('submit', function(event) {
        event.preventDefault(); // Prevent default form submission

        let isValid = true;

        // Validate Name
        const nameInput = document.getElementById('name');
        if (nameInput.value.trim() === '') {
            alert('Name cannot be empty.');
            isValid = false;
        }

        // Validate Email
        const emailInput = document.getElementById('email');
        const emailPattern = /^[a-zA-Z0-9._-]+@[a-zA-Z0-9.-]+\.[a-zA-
Z]{2,6}$/;
        if (!emailPattern.test(emailInput.value.trim())) {
            alert('Please enter a valid email address.');
            isValid = false;
        }

        // Validate Phone Number
        const phoneInput = document.getElementById('phone');
        const phonePattern = /^[0-9]{3}-[0-9]{3}-[0-9]{4}$/;
        if (!phonePattern.test(phoneInput.value.trim())) {
            alert('Please enter a valid phone number (e.g., 123-456-
7890).');
            isValid = false;
        }
```

```
        // Validate Session Selection
        const sessionSelect = document.getElementById('session');
        if (sessionSelect.value === '') {
            alert('Please select a session.');
            isValid = false;
        }

        if (isValid) {
            alert('Registration successful!');
            // In a real application, you would send the form data to
a server here
            form.reset(); // Optionally reset the form after
successful submission
        }
    });
});

print("Created registration_script.js with form validation
functionality.")
```

```
Writing registration_script.js
```

Build Resume Website (Task 4)

Subtask:

Create a one-page HTML resume with sections for 'Profile Summary', 'Skills', 'Education', and 'Experience'. Use CSS Grid for aligning sections and implement smooth scroll navigation.

Reasoning: The first step is to create the basic HTML structure for the resume website in `resume.html`, including the 'Profile Summary', 'Skills', 'Education', and 'Experience' sections, a navigation bar, and links to the CSS and JavaScript files as instructed.

```
%%writefile resume.html
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-
scale=1.0">
    <title>My Resume</title>
    <link rel="stylesheet" href="resume_style.css">
</head>
<body>
    <nav>
        <ul>
            <li><a href="#summary">Profile Summary</a></li>
            <li><a href="#skills">Skills</a></li>
            <li><a href="#education">Education</a></li>
```

```
            <li><a href="#experience">Experience</a></li>
        </ul>
    </nav>

    <script src="resume_script.js"></script>
</body>
</html>
print("Created resume.html with basic resume structure.")
```

```
Writing resume.html
```

Reasoning: Now that the HTML structure for the resume is in place, the next step is to create the `resume_style.css` file to apply professional styling, implement a CSS Grid layout for aligning sections, and ensure the layout is responsive, as specified in the subtask.

```
%%writefile resume_style.css
:root {
    --primary-color: #34495e; /* Dark Blue/Gray */
    --secondary-color: #2ecc71; /* Green */
    --text-color: #333;
    --background-color: #f4f4f4;
    --light-text-color: #7f8c8d;
```

```
    --border-color: #ecf0f1;
}

body {
    font-family: 'Roboto', sans-serif;
    margin: 0;
    padding: 0;
    box-sizing: border-box;
    background-color: var(--background-color);
    color: var(--text-color);
    line-height: 1.6;
}

.container {
    max-width: 1200px;
    margin: 20px auto;
    padding: 20px;
    background-color: #fff;
    border-radius: 8px;
    box-shadow: 0 4px 10px rgba(0,0,0,0.1);
}

header {
    text-align: center;
    margin-bottom: 30px;
    padding-bottom: 20px;
    border-bottom: 1px solid var(--border-color);
}

header h1 {
    color: var(--primary-color);
    font-size: 3em;
    margin: 0;
}

header p {
    color: var(--light-text-color);
    font-size: 1.2em;
}

nav {
    background-color: var(--primary-color);
    padding: 1rem 0;
    position: sticky;
    top: 0;
    z-index: 1000;
    box-shadow: 0 2px 5px rgba(0,0,0,0.2);
}

nav ul {
```

```
    list-style: none;
    padding: 0;
    margin: 0;
    display: flex;

        grid-area: skills;
    }

    .education {
        grid-area: education;
    }

    .experience {
        grid-area: experience;
    }

    /* Adjusting sections to be within grid areas */
    .profile-summary,
    .skills,
    .education,
    .experience {
        margin: 0;
    }

    nav ul {
        flex-direction: row;
    }

    nav ul li {
        margin-bottom: 0;
    }
}

@media (max-width: 767px) {
    nav ul {
        flex-direction: column;
        align-items: center;
        gap: 10px;
    }
    nav ul li {
        margin-bottom: 5px;
    }

    header h1 {
        font-size: 2.5em;
    }
```

```
    header p {
        font-size: 1em;
    }

    h2 {
        font-size: 1.8em;
    }

    section {
        padding: 30px 15px;
    }
}

@media (max-width: 480px) {
    .container {
        margin: 10px auto;
        padding: 10px;
    }

    header h1 {
        font-size: 2em;
    }

    h2 {
        font-size: 1.5em;
    }

    .education-item, .experience-item {
        padding-left: 10px;
    }
}
print("Created resume_style.css with professional styling, CSS Grid,
and responsiveness.")

Writing resume_style.css
```

Reasoning: Now that the HTML structure and CSS styling for the resume are in place, the final step for this subtask is to implement the smooth scrolling navigation functionality using JavaScript. This will involve creating the `resume_script.js` file and adding an event listener to the navigation links to handle smooth scrolling.

```
%%writefile resume_script.js
document.querySelectorAll('nav ul li a').forEach(anchor => {
    anchor.addEventListener('click', function (e) {
        e.preventDefault();

document.querySelector(this.getAttribute('href')).scrollIntoView({
            behavior: 'smooth'
        });
```

```
    });
});

print("Created resume_script.js with smooth scrolling functionality.")
```

```
Writing resume_script.js
```

Design Restaurant Menu Page (Task 5)

Subtask:

Develop an HTML page to display menu items with name, description, and price.

Reasoning: The first step for creating the restaurant menu page is to construct the basic HTML structure in `menu.html`, including the boilerplate, linking to `menu_style.css`, a main heading, and placeholder menu items with name, description, and price.

```
%%writefile menu.html
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-
scale=1.0">
    <title>Restaurant Menu</title>
    <!-- Link to CSS file -->
    <link rel="stylesheet" href="menu_style.css">
</head>
<body>
    <div class="container">
        <h1>Our Delicious Menu</h1>

        <div class="menu-container">
            <!-- Menu Item 1 -->
            <div class="menu-item">
                <h3>Classic Burger</h3>
                <p>A juicy beef patty with lettuce, tomato, onion, and
pickles, served on a toasted bun.</p>
                <span class="price">$12.99</span>
            </div>

            <!-- Menu Item 2 -->
            <div class="menu-item">
                <h3>Margherita Pizza</h3>
                <p>Fresh mozzarella, basil, and a rich tomato sauce on
a crispy, thin crust.</p>
                <span class="price">$15.50</span>
            </div>
```

```
            <!-- Menu Item 3 -->
            <div class="menu-item">
                <h3>Caesar Salad</h3>
                <p>Crisp romaine lettuce, croutons, Parmesan cheese,
and a creamy Caesar dressing.</p>
                <span class="price">$9.75</span>
            </div>
        </div>
    </div>
</body>
</html>
print("Created menu.html with basic structure for restaurant menu.")
```

```
Writing menu.html
```

Reasoning: Now that the HTML structure for the menu page is created, the next step is to create the `menu_style.css` file to apply styling, ensuring the menu items are visually appealing and the page has a professional look, as implied by the subtask.

```
%%writefile menu_style.css
:root {
    --primary-color: #A52A2A; /* Brownish Red */
    --secondary-color: #FFD700; /* Gold */
    --text-color: #333;
    --background-color: #F8F8F8;
    --light-text-color: #666;
    --border-color: #DDD;
}

body {
    font-family: 'Georgia', serif;
    margin: 0;
    padding: 0;
    box-sizing: border-box;
    background-color: var(--background-color);
    color: var(--text-color);
    line-height: 1.6;
}

.container {
    max-width: 960px;
    margin: 30px auto;
    padding: 20px;
    background-color: #FFF;
    border-radius: 8px;
    box-shadow: 0 4px 10px rgba(0,0,0,0.1);
}

h1 {
```

```
    text-align: center;
    color: var(--primary-color);
    margin-bottom: 40px;
    font-size: 3em;
    font-weight: normal;
    border-bottom: 2px solid var(--secondary-color);
    padding-bottom: 10px;
}

.menu-container {
    display: grid;
    grid-template-columns: repeat(auto-fit, minmax(300px, 1fr));
    gap: 30px;
    padding: 20px 0;
}

.menu-item {
    background-color: #FDFDFD;
    border: 1px solid var(--border-color);
    border-radius: 8px;
    padding: 20px;
    box-shadow: 0 2px 5px rgba(0,0,0,0.05);
    display: flex;
    flex-direction: column;
    justify-content: space-between;
    transition: transform 0.2s ease, box-shadow 0.2s ease;
}

.menu-item:hover {
    transform: translateY(-5px);
    box-shadow: 0 6px 12px rgba(0,0,0,0.1);
}

.menu-item h3 {
    color: var(--primary-color);
    font-size: 1.8em;
    margin-top: 0;
    margin-bottom: 10px;
}

.menu-item p {
    color: var(--light-text-color);
    font-size: 1em;
    margin-bottom: 15px;
    flex-grow: 1;
}

.menu-item .price {
    color: var(--secondary-color);
    font-size: 1.5em;
```

```
    font-weight: bold;
    text-align: right;
    margin-top: 10px;
}

/* Responsive Design */
@media (max-width: 768px) {
    .container {
        margin: 20px;
        padding: 15px;
    }

    h1 {
        font-size: 2.5em;
        margin-bottom: 30px;
    }

    .menu-container {
        gap: 20px;
    }

    .menu-item h3 {
        font-size: 1.5em;
    }

    .menu-item .price {
        font-size: 1.3em;
    }
}

@media (max-width: 480px) {
    h1 {
        font-size: 2em;
        margin-bottom: 20px;
    }

    .menu-item {
        padding: 15px;
    }

    .menu-item h3 {
        font-size: 1.3em;
    }

    .menu-item p {
        font-size: 0.9em;
    }

    .menu-item .price {
        font-size: 1.2em;
```

```
    }
}
print("Created menu_style.css with professional styling and responsiveness.")
```

```
Writing menu_style.css
```

Final Task

Subtask:

Summarize the completed web development tasks, highlighting the application of responsive design, accessibility, interactive components, and the role of AI assistance in optimizing various aspects of each project.

Summary:

Data Analysis Key Findings

- **Responsive Design Implementation Across Projects**:
  - **Portfolio Website**: Utilized Flexbox for overall `body` structure and media queries at `max-width: 768px` and `max-width: 480px` to adjust navigation (vertical stack) and section styling.
  - **Online Store Product Page**: Employed Flexbox to dynamically change the product layout from a column to a row at `min-width: 768px`, complemented by media queries for finer adjustments in padding, font sizes, and button width on smaller screens.
  - **Event Registration Form**: Incorporated media queries at `max-width: 600px` to optimize container padding, heading font size, and form element sizes for mobile devices.
  - **Resume Website**: Leveraged CSS Grid with `grid-template-areas` to create a complex, responsive layout for different sections on larger screens (`min-width: 768px`), while media queries adapted navigation and font sizes for smaller viewports.
  - **Restaurant Menu Page**: Implemented a highly flexible CSS Grid layout using `repeat(auto-fit, minmax(300px, 1fr))` for the `menu-container`, ensuring menu items fluidly adjust to available space, supported by media queries for font and spacing adjustments.
- **Interactive Components for Enhanced User Experience**:
  - **Smooth Scrolling Navigation**: Both the Portfolio and Resume websites implemented smooth scrolling via JavaScript, using `scrollIntoView({ behavior: 'smooth' })` when navigation links are clicked.
  - **Dynamic Hover Effects**: The Online Store Product Page featured hover effects on the product image (`transform: scale(1.05)`) and 'Add to Cart' button (background color change and `transform: translateY(-2px)`), while the

Restaurant Menu Page applied hover effects (`transform: translateY(-5px)`) to individual menu items.
  - **'Add to Cart' Alert**: The Online Store Product Page included a JavaScript alert "Item added to cart!" on button click, providing immediate user feedback.
  - **Client-Side Form Validation**: The Event Registration Form utilized comprehensive JavaScript validation for name (not empty), email (regex format), phone number (regex `123-456-7890` format), and session selection (not default option), enhancing data quality and user guidance.
- **Focus on Accessibility and Semantic Structure**:
  - **Semantic HTML**: All projects consistently used appropriate semantic HTML elements (e.g., `<nav>`, `<header>`, `<section>`, `<form>`, `<label>`) to improve document structure and aid assistive technologies.
  - **Form Accessibility**: The Event Registration Form explicitly linked `<label>` elements to their respective `<input>` fields using `for` and `id` attributes, included `required` attributes, and provided a `pattern` attribute with a `small` tag for phone number format guidance.
  - **Image Accessibility**: The Online Store Product Page used `alt` text for the product image, ensuring content is accessible even if the image fails to load or for screen readers.
- **Role of AI Assistance in Optimization**:
  - The AI assistance (the agent) played a crucial role by successfully translating high-level task descriptions into precise, functional, and well-structured HTML, CSS, and JavaScript code for each project.
  - It consistently applied best practices such as CSS variables for theming, BEM methodology for CSS styling in the product page, and generated robust validation logic and interactive scripts, significantly optimizing the development workflow and ensuring adherence to specifications.

Insights or Next Steps

- The consistent application of responsive design techniques (Flexbox, CSS Grid, media queries) demonstrates a strong foundation for building versatile web applications. Further development could focus on advanced accessibility features like ARIA attributes and keyboard navigation.
- The effective use of AI assistance for code generation significantly streamlines the initial development phases of web projects, allowing developers to focus on higher-level architecture, complex interactions, and comprehensive testing rather than boilerplate code.
